**Electric Heater Sizing**

This chart provides an easy reference to estimate the kW required to heat a tank. Heat losses from the surface of the solution and from the sides of the tank have been taken into account. Find the gallons at the left, move to the right to the column with the temperature at which you will be heating the solution. The number indicated here is the kW required to do the heating job. This kW figure assumes a heat-up period of six hours; for a twelve hour heat-up time simply divide the kW figure in half.

To determine the heating requirement of a tank, first obtain the following information:

1) Total cubic feet of solution in tank: Multiply the inside dimensions of the tank in feet - length x width x solution depth. (One m³ = 35.3 ft³)
2) Total gallons of solution: Multiply by 7.48 the cubic feet of the tank occupied by solution. If the solution is normally 6" below the top of the tank, allow for this when figuring. (3.8 liters = one gallon)
3) Average ambient (room) temperature at which tank will be used in °F. (9/5°C + 32 = °F)
4) Temperature level at which solution is to be held in °F.
5) Heat up time desired in hours.

Losses due to agitation, ventilation and work loads should be considered in calculating total KW requirements.

Losses due to agitation, ventilation and work loads should be considered in calculating total KW requirements.

After this information is known, the following calculations can be made:

\[
\frac{A \times 1.0^* \times 8.35^{**} \times B}{3412 \times C} + \frac{D \times E}{=} \text{KW requirement of the tank.}
\]

Add the results of both calculations. The total is the Kilowatt requirement of the tank.

- **A** = Total gallons of solution. (One liter = .264 gallons)
- **B** = Difference from ambient temperature and desired solution temperature in °F.
- **C** = Desired heat up time (hours).
- **D** = Heat loss of tank. Refer to charts below
- **E** = Square feet of top of tank. Multiply length x width.
- *** = Specific heat of water. Insert specific heat of your solution here.
- **** = Weight of water in pounds (8.35). Insert specific weight of your solution here. (One kilogram = 2.2 pounds)

Check Immersion Heater Solution Guide for proper sheath material.
GENERAL ENGINEERING DATA

**WATTS (W)**
\[
\text{Watts} = \frac{\text{Volts}^2}{\text{Ohms}}
\]
\[
\text{Watts} = \text{Amperes}^2 \times \text{Ohms}
\]
\[
\text{Watts} = \text{Volts} \times \text{Amperes}
\]

**VOLTS (E)**
\[
\text{Volts} = \sqrt{\text{Watts} \times \text{Ohms}}
\]
\[
\text{Volts} = \frac{\text{Watts}}{\text{Amperes}}
\]
\[
\text{Volts} = \text{Amperes} \times \text{Ohms}
\]

ALL ELECTRIC HEATER APPLICATIONS SHOULD BE GROUNDED BEFORE OPERATION.

**AMPERES (I)**

*Single Phase*
\[
\text{Amperes} = \frac{\text{Volts}}{\text{Ohms}}
\]
\[
\text{Amperes} = \frac{\text{Watts}}{\text{Volts}}
\]
\[
\text{Amperes} = \sqrt{\frac{\text{Watts}}{\text{Ohms}}}
\]

*Three Phase*
\[
\text{Amperes} = \frac{\text{Watts}}{\text{Volts} \times 1.73}
\]

**OHMS (R)**

*Single Phase*
\[
\text{Ohms} = \frac{\text{Volts}}{\text{Amperes}}
\]
\[
\text{Ohms} = \frac{\text{Watts}^2}{\text{Watts}}
\]
\[
\text{Ohms} = \frac{\text{Watts}}{\text{Amperes}^2}
\]

AMPERAGE CALCULATION

For **single phase** or two wire power supplies to heaters:
\[
\text{AMP RATING} = \frac{\text{Total capacity (watts)}}{\text{Line voltage}}
\]
Example: 4000 watts = 16.67 Amps
\[
\frac{240 \text{ volts}}{}
\]

For **three phase** balanced power supplies (Delta or Wye connections) to heaters using a three-pole contactor:
\[
\text{AMP RATING} = \frac{\text{Total capacity (watts)}}{\text{Line voltage} \times 1.73}
\]
Example: 4000 watts = 9.63 Amps
\[
\frac{240 \times 1.73}{240 \text{ volts} x 1.73}
\]

CONTACTER SIZING: *Amp rating per pole x 1.25 = contator rating. Round up to nearest standard size.

Wattage varies as the square of the voltage. Graph on the left provides a quick method of finding the percent change in wattage caused by operating at various percentages of rated voltage. Heaters are designed to have a give wattage output at a specified voltage and operation at other voltages affects the wattage output considerably. The following ratio can also be used.

\[
\text{Watts (actual)} = \frac{\text{watts [rated]}}{\text{volts [rated]}} \times \frac{x (\text{volts [actual]})^2}{\text{volts [rated]}}
\]

**WARNING**

ELECTRIC IMMERSION HEATERS WILL IGNITE MANY PLASTIC TANKS SUCH AS POLYPROPYLENE AND POLYETHYLENE, AND SUBJECT PERSONNEL TO SHOCK HAZARD IF NOT PROPERLY INSTALLED AND MAINTAINED.

WATTAGE CHANG VS. VOLTAGE CHANGE

Watts (actual) = \(\frac{\text{watts [rated]}}{\text{volts [rated]}} \times \frac{x (\text{volts [actual]})^2}{\text{volts [rated]}}\)
